

#### **Specifications:**

Equipment Size: 167 x 92 x 51cm

Equipment Weight: 89kg

Shipping Type: Self contained flight case

Shipping Size: 167 x 92 x 51cm

Shipping Weight: 105kg

Noise: 96db at 3m

Additional requirements: Confetti, 4x34kg CO<sub>2</sub> liquid, offtake cylinders (40LK) Cylinder connection thread: RH 0.860 in x 14 TPI male

Suggested for set up: 1 person

Duration of effect: 120 to 200 seconds

Approx. height of effect: 20 metres

Notes:

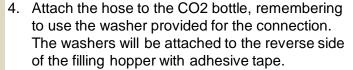

Suggested quantity of Confetti: 10kgs.

# **Technical Datasheet**XL Master Blaster

The XL Master Blaster is the largest of 3. It is a CO<sub>2</sub> powered confetti blower that fires up to 30m

### How to set up and use the XL Master Blaster

- 1. Position the machine on level ground and secure the brakes.
- 2. Lift the horn from inside the flight case and secure it to the main body using the bar and lock pin (fig.2), then set to the required firing angle.
- 3. Ensure the ball valve handle on the hose is in the 'closed' position (fig.3).

- 6. Briefly turn 'on' and 'off' the CO2 bottle to check for leaks at the bottle connection.
- 7. Place a small quantity (a few handfuls) of confetti in the hopper of the machine.
- 8. No more than 5 seconds before the event cue, turn the CO2 bottles 'on'
- On the cue open the ball valve (fig.4) and steadily feed confetti into the hopper (fig.5). Be aware that the machine may push backwards when in use.
- 10. Once the cue has finished immediately turn the ball valve to the 'closed' position.
- 11. Turn off the CO2 bottles.
- 12. Before attempting to disconnect the hoses, depressurise the system by ensuring the CO2 bottles are turned off then slowly open the ball valve to release pressure left in the hose.

## **Technical Datasheet**XL Master Blaster

- 13. Disconnect the hose from the bottles, ensure all the washers are removed and stuck to the adhesive tape.
- 14. Do not disconnect the hoses from the horn.

Fig 6. Valve Closed

16. Store the hose in the hopper ready for transportation.

## Hints/Tips/Safety:

Wear gloves when handling frosted metal; CO2 can burn when not handled correctly.

A white plume of gas is normal; it means the machine is working correctly.

Noise is created by the CO2 venting through the hose; this is normal.

Ensure nothing loose is nearby; anything that gets sucked into the back of the machine will come out at high speed. Be aware of wind direction and allow plenty of space when operating.

The machine is supplied with two bottle connections as standard; if required they can be modified to use on one connection, however this will shorten the duration of the effect.

For maximum effect we advise that four 34 kilo liquid withdrawal bottles are used.

Place the confetti in a box rather than a bag for easier loading when the machine is turned on,

Prolonged use of CO2 carries an inherent risk of asphyxiation
